

32W Hi-Fi AUDIO POWER AMPLIFIER

- HIGH OUTPUT POWER
(50W MUSIC POWER IEC 268.3 RULES)
- HIGH OPERATING SUPPLY VOLTAGE (50V)
- SINGLE OR SPLIT SUPPLY OPERATIONS
- VERY LOW DISTORTION
- SHORT CIRCUIT PROTECTION (OUT TO GND)
- THERMAL SHUTDOWN

DESCRIPTION

The TDA 2050 is a monolithic integrated circuit in Pentawatt package, intended for use as an audio class AB audio amplifier. Thanks to its high power capability the TDA2050 is able to provide up to 35W true rms power into 4 ohm load @ THD = 10%, $V_S = \pm 18V$, $f = 1KHz$ and up to 32W into 8ohm load @ THD = 10%, $V_S = \pm 22V$, $f = 1KHz$.

Moreover, the TDA 2050 delivers typically 50W music power into 4 ohm load over 1 sec at $V_S = 22.5V$, $f = 1KHz$.

Pentawatt

ORDERING NUMBERS: TDA2050V
TDA2050H

The high power and very low harmonic and cross-over distortion (THD = 0.05% typ, @ $V_S = \pm 22V$, $P_O = 0.1$ to 15W, $R_L = 8ohm$, $f = 100Hz$ to 15KHz) make the device most suitable for both HiFi and high class TV sets.

Figure 1: Split Supply Typical Application Circuit**Figure 2:** P.C. Board and Components Layout of the Circuit of Fig. 1 (1:1)

SPLIT SUPPLY APPLICATION SUGGESTIONS

The recommended values of the external components are those shown on the application circuit

of fig. 2. Different values can be used. The following table can help the designer.

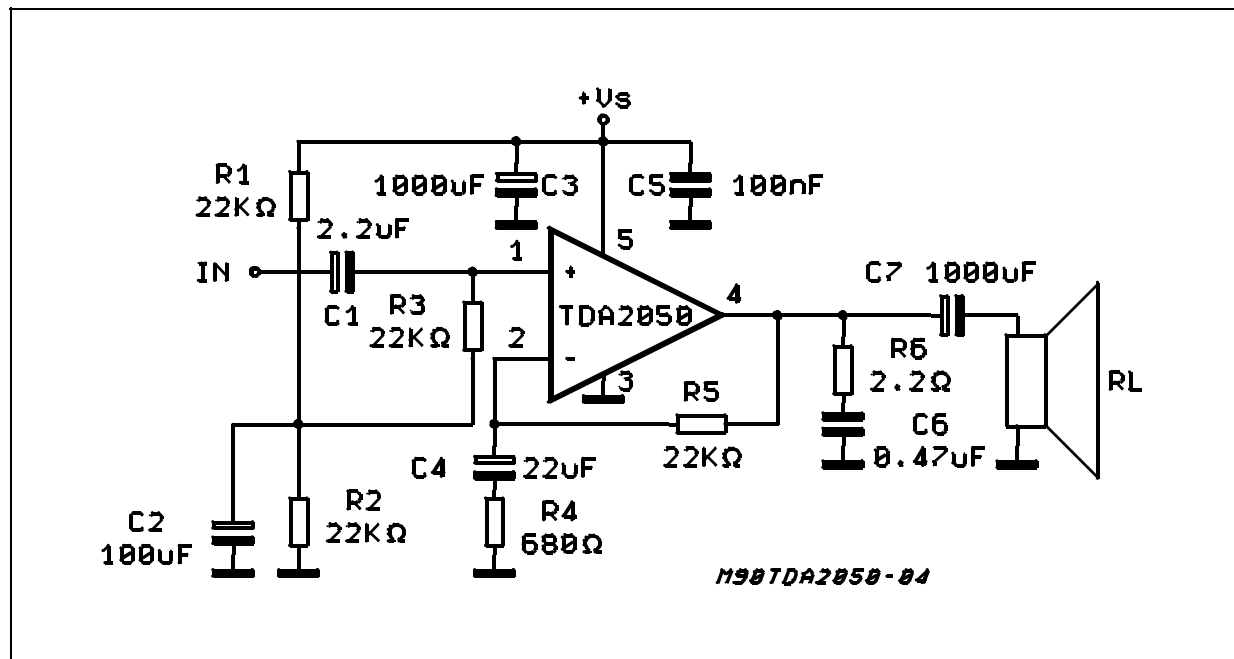

Component	Recommended Value	Purpose	Larger than Recommended Value	Smaller than Recommended Value
R1	22k Ω	Input Impedance	Increase of Input Impedance	Decrease of Input Impedance
R2	680 Ω	Feedback Resistor	Decrease of Gain (*)	Increase of Gain
R3	22k Ω		Increase of Gain	Decrease of Gain (*)
R4	2.2 Ω	Frequency Stability	Danger of Oscillations	
C1	1 μ F	Input Decoupling DC		Higher Low-frequency cut-off
C2	22 μ F	Inverting Input DC Decoupling	Increase of Switch ON/OFF Noise	Higher Low-frequency cut-off
C3 C4	100nF	Supply Voltage Bypass		Danger of Oscillations
C5 C6	220 μ F	Supply Voltage Bypass		Danger of Oscillations
C7	0.47 μ F	Frequency Stability		Danger of Oscillations

(*) The gain must be higher than 24dB

PRINTED CIRCUIT BOARD

The layout shown in fig. 2 should be adopted by the designers. If different layouts are used, the

ground points of input 1 and input 2 must be well decoupled from the ground return of the output in which a high current flows.

Figure 3: Single Supply Typical Application Circuit**Figure 4:** P.C. Board and Components Layout of the Circuit of Fig. 3 (1:1)

SINGLE SUPPLY APPLICATION SUGGESTIONS

The recommended values of the external components are those shown on the application circuit

of fig. 3. Different values can be used. The following table can help the designer.

Component	Recommended Value	Purpose	Larger than Recommended Value	Smaller than Recommended Value
R1, R2, R3	22k Ω	Biasing Resistor		
R4	680 Ω	Feedback Resistors	Increase of Gain	Decrease of Gain (*)
R5	22k Ω		Decrease of Gain (*)	Increase of Gain
R6	2.2 Ω	Frequency Stability	Danger of Oscillations	
C1	2.2 μ F	Input Decoupling DC		Higher Low-frequency cut-off
C2	100 μ F	Supply Voltage Rejection	Worse Turn-off Transient Worse Turn-on Delay	
C3	1000 μ F	Supply Voltage Bypass		Danger of Oscillations Worse of Turn-off Transient
C4	22 μ F	Inverting Input DC Decoupling	Increase of Switching ON/OFF	Higher Low-frequency cut-off
C5	100nF	Supply Voltage Bypass		Danger of Oscillations
C6	0.47 μ F	Frequency Stability		Danger of Oscillations
C7	1000 μ F	Output DC Decoupling		Higher Low-frequency cut-off

(*) The gain must be higher than 24dB

NOTE

If the supply voltage is lower than 40V and the load is 8ohm (or more) a lower value of C2 can

be used (i.e. 22 μ F).

C7 can be larger than 1000 μ F only if the supply voltage does not exceed 40V.

SHORT CIRCUIT PROTECTION

The TDA 2050 has an original circuit which limits the current of the output transistors. The maximum output current is a function of the collector emitter voltage; hence the output transistors work within their safe operating area. This function can therefore be considered as being peak power limiting rather than simple current limiting.

It reduces the possibility that the device gets damaged during an accidental short circuit from AC output to ground.

THERMAL SHUTDOWN

The presence of a thermal limiting circuit offers the following advantages:

- 1) An overload on the output (even if it is permanent), or an above limit ambient temperature can be easily tolerated since the T_j cannot be higher than 150°C .
- 2) The heatsink can have a smaller factor of safety compared with that of a conventional circuit. There is no possibility of device damage due to high junction temperature. If for any reason, the junction temperature increases up to 150°C , the thermal shutdown simply reduces the power dissipation and the current consumption.

The maximum allowable power dissipation depends upon the thermal resistance junction-ambi-

ent. Fig. 17 shows this dissipable power as a function of ambient temperature for different thermal resistance.

Figure 17: Maximum Allowable Power Dissipation vs. Ambient Temperature

MOUNTING INSTRUCTIONS

The power dissipated in the circuit must be removed by adding an external heatsink.

Thanks to the PENTAWATT package, the heatsink mounting operation is very simple, a screw or a compression spring (clip) being suffi-

cient. Between the heatsink and the package is better to insert a layer of silicon grease, to optimize the thermal contact; no electrical isolation is needed between the two surfaces. Fig. 18 shows an example of heatsink.

Dimension suggestion

The following table shows the length that the heatsink in fig. 18 must have for several values of Ptot and Rth.

P _{tot} (W)	12	8	6
Length of heatsink (mm)	60	40	30
R _{th} of heatsink (°C/W)	4.2	6.2	8.3

Figure 18: Example of heat-sink

APPENDIX A

A.1 - MUSIC POWER CONCEPT

MUSIC POWER is (according to the IEC clauses n.268-3 of Jan 83) the maximum power which the amplifier is capable of producing across the rated load resistance (regardless of non linearity) 1 sec after the application of a sinusoidal input signal of frequency 1 KHz.

According to this definition our method of measurement comprises the following steps:

- Set the voltage supply at the maximum operating value;
- Apply a input signal in the form of a 1KHz tone burst of 1 sec duration: the repetition period of the signal pulses is 60 sec;
- The output voltage is measured 1 sec from the start of the pulse;
- Increase the input voltage until the output signal shows a THD=10%;
- The music power is then V_{out}^2 / R_L , where V_{out} is the output voltage measured in the condition of point 4 and R_L is the rated load impedance;

The target of this method is to avoid excessive dissipation in the amplifier.

A.2 - INSTANTANEOUS POWER

Another power measurement (MAXIMUM INSTANTANEOUS OUTPUT POWER) was proposed by IEC in 1988 (IEC publication 268-3 sub-clause 19.A).

We give here only a brief extract of the concept, and a circuit useful for the measurement.

The supply voltage is set at the maximum operating value.

The test signal consists of a sinusoidal signal whose frequency is 20 Hz, to which are added alternate positive and negative pulses of 50 μ s duration and 500 Hz repetition rate. The amplitude of the 20 Hz signal is chosen to drive the amplifier to its voltage clipping limits, while the amplitude of the pulses takes the amplifier alternately into its current-overload limits.
